Notes:

1. Uni-COM™ CB modules plug directly into the Uni-COM Jack on the side of the controller.
   This controller supports Uni-COM modules as follows:
   - One serial module
   - One CANbus module, which may be followed by a single serial module.

   For more information, refer to the product's installation guide.

2. When replacing the unit's battery, make sure that the new one has environmental specifications that are similar or better than the one specified in this document.
3. The 4-20mA input option is implemented using 0-20mA input range.
4. The analog inputs measure values that are slightly higher than the nominal input range (Input Over-range).

   Note that when the input overflow occurs, it is indicated in the corresponding I/O Status tag as well as by the respective input LED (see LED Indications), while the input value is registered as the maximum permissible value. For example, if the specified input range is 0 ÷ 10V, the Over-range values can reach up to 10.15V, and any input voltage higher than that will still register as 10.15V while the Overflow system tag is turned on.
5. See LED Indications Table for description of the relevant indications. Note that the diagnostics results are also indicated in the system tags and can be observed through the UniApps™ or the online state of the UniLogic®.
6. Step response and update time are independent of the number of channels that are used.
7. Life expectancy of the relay contacts depends on the application that they are used in. The product's installation guide provides procedures for using the contacts with long cables or with inductive loads.
8. Outputs O0 and O1 can be configured as either normal digital outputs or as PWM outputs. PWM outputs specifications apply only when outputs are configured as PWM outputs.
9. This refers to the CONFIRM button on the controller USB Actions; press it if the indication requires.
